Buncefield rebuild calls on Colourgalv expertise from Highland Galvanizers

Colourgalv was chosen as the preferred coating for the process piping at the rebuild of the Buncefield Tank Farm. Colourgalv provides both the internal and external corrosion protection through hot dip galvanizing, whilst the durable powder coated colour finish is used to denote the contents of each pipe.

In addition the pre-coat finish allows for fast erection and installation, without the need for scaffolding, weather delays or paint contractor issues. In addition, Colourgalv can be guaranteed for up to 25 years before first major maintenance may be required.

Paul McCafferty, Sales Director at Highland, said, "Colourgalv is available in over 250 colours, and a variety of textures. It was originally developed as the ideal metal coating solution for the construction industry. However as the solution has strong sustainability credentials, and is VOC free, ever more applications are being developed throughout the complete built environment."

As one of only two Akzo Nobel / Interpon approved applicators in the UK for powder coating application onto a galvanized substrate, Highland Galvanizers

and Colour Coaters are ideally placed to supply solutions to any project. Consultancy advice is offered throughout the UK through their network of

technical consultants.
